Preparing eukaryotic alkaline and for dephosphorylation, by for high gene copy number. phosphatase, recombinant expression diagnostic reagent in yeast selected

Claim 2; SEQ ID NO 1; 23pp; German.

This invention of phosphatase in gene sequence in purifying. A fin selection marked and alkaline phosphataline pho medium containing a marker In describes a novel method of preparing eukaryotic alkaline in yeast cells, comprising cloning an alkaline phosphatase into different vectors, transforming, and expressing and first vector is used containing a resistance gene against a ker and transformants that have integrated resistance gene phosphatase gene into the genome are selected by growth on ning a low concentration of selection marker. The gene copy

```
selected on growth medium under high selection pressure. A second vector containing the alkaline phosphatase gene and a second resistance gene against a second marker is introduced, its copy number increased as for the first resistance gene and clones selected that have many copies of the alkaline phosphatase gene and of both resistance genes, integrated into the genome. The vectors used in the method are pHAP10-3 and pHAP10-3/9K. Preferred cells include methylotrophic yeast, particularly Pichia pastoris and Hansenula polymorpha and specifically P. pastoris X-33 cransformed with phAP10-3 and pHAP10-3/9K. The amino acid sequence of bovine alkaline phosphatase is known and, working back from this, an optimised codon sequence was designed. This was assembled conventionally from 28 synthetic oligonucleotides to give a sequence having EcoRI and Asp718 recognition sites at the ends to facilitate cloning. The selection markers are particularly zeomycin and G418, respectively. The alkaline phosphatase is used as diagnostic reagent, as part of a conjugate and for dephosphorylation of DNA. This method produces very active, glycosylated calkaline phosphatase with specific activity over 3000, preferably 10000, units/mg and heat stability comparable with that for commercial enzymes. The expression without any selection pressure. This sequence represents the covine bIAPII gene.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Query Match 100.0%;

                                                                   문
                                                                                                                                                                                                                                                                           This invention describes a novel mutant of eukaryotic alkaline phosphatase where the wild-type sequence is at least 77% homologous with CC ADE53385 and where the alkaline phosphatase activity is reduced by at least 100-fold, relative to the wild type. The mutations described are Asp42, 316 or 357 for Asn, Val, Ala or Ser; Ser92 or 155 for Ala, Gly, CV Val or Leu; Glu311 for Gln, Asn, Leu, Ile or Met; His320, 358 or 432 for C Asn, Phe, Asp or Tyr; or Gly322 for an amino acid larger than Asp. C Conjugates of the novel mutant with antibodies are useful in alkaline phosphatase-based immunoassays for antigens as interference suppressors, i.e. they prevent non-specific binding of active alkaline phosphatase-C based conjugates to vessel walls or first antibodies, a phenomenon that may result in false positive results. The mutants have almost the same tertiary and quaternary structures as wild-type alkaline phosphatase, so are very specific interference suppressors. This sequence encodes the wild-type bovine alkaline phosphatase described in the disclosure of the invention.
                                                                                                                                                                                                                      Query Match

                                                                                                                                                                                                                                            The present invention describes a method of forming a polynucleotide sequence, comprising: (a) generating a nucleic acid fragment ladder by nucleic acid synthesis; (b) removing the chain-terminating molecules of changing them into non-terminating molecules; and (c) reassembling the polynucleotide. Also described is a method for providing mutant polypeptides or proteins are useful for sequence and providing mutant polypeptides or proteins are useful for optimising biomolecules and enzymes. The present sequence represents a calf intestinal alkaline phosphatase (ciap) DNA sequence, which is used in an example from the present invention for the recombination of human placental alkaline phosphatase (hpap) and ciap genes
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Calf
                                                                                                                                                                                                                         Sequence
                                                                                                                                                                                                                                                                                                                                                                                                                                  Forming a polynucleotide sequence for optimizing biomolecules and by generating a nucleic acid fragment ladder, removing the chain-terminating molecules and reassembling the polynucleotide.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         WPI;

   The invention relates to polynucleotides (AAK51456-AAK53435) and the encoded polypeptides (AAM78323-AAM80302) that exhibit activity elating to cytokine, cell proliferation or cell differentiation or which may induce production of other cytokines in other cell populations. The polynucleotides and polypeptides are useful in gene therapy, vaccines or peptide therapy. The polypeptides have various cytokine-like activities, e.g. stem cell growth factor activity, haematopoiesis regulating activity, tissue growth factor activity, immunomodulatory activity and activiny inhibin activity and may be useful in the diagnosis and/or treatment of cancer, leukaemia, nervous system disorders, arthritis and inflammation. Note: Records for SEQ ID NO 2110 (AAK52581), 2111
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          vaccine; peptide therapy tissue growth factor; imprervous system disorder;

P-PSDB; AAR91805.

Recombinant alkaline phosphatase (AP)-antibody fusion protein - comprise AP fused downstream of antibody heavy or light chain, useful as immunoassay reagent.

Example 1; Page 10-12; 44pp; Japanese.

The gene coding for human alkaline phosphatase is fused downstream of a gene coding for either the variable and CH1 regions of an antibody heavy chain or an antibody light chain. Coexpression of the H- and L-chain sequences, one of which is fused to the AP gene, results in production of AP-labelled antibodies suitable for use in immunoassays. The present sequence codes for human AP

Obtaining vascular s selecting genes.
The present invention relates to a method for obtaining a vasodilating substance which increases expression of vasodilation response genes, and obtaining a vasodepressor which increases or decreases the expression level of vasodilation response genes. The method is useful for obtaining vasodilating substance which increases/decreases expression of vasodilation response genes. The vasodepressor substance obtained by the method of the invention is useful as an antihypertensive drug. The method is also useful for identifying the specific vasodilator-response genes. The present sequence represents a human vasodilator-responsive gene.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              2004-015357/02.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                TANAKA T.

                                                                              The present invention describes a method for detecting high-grade dysplasia (HGD) in cells of a mammalian tissue sample. Also described: (1) identifying an oesophageal tissue susceptible to oesophageal adenocarcinoma; (2) determining the predisposition of a mammalian tissue to a neo-plastic transformation by detecting HGD in cells of the tissue; and (3) detecting cancer in a patient. The method can be used in detecting HGD and cancer in cells of a mammalian tissue sample. The methods and compositions of the present invention can be used in treating and preventing HGD and cancer, and in gene therapy. The present sequence encodes human alkaline phosphatase intestinal precursor (PPBI), which is used in the exemplification of the present invention. The human PPBI gene is located on chromosome 2.
                                                                                                                                                                                                                                                                                     Detecting of high-grade dysplasia in cells of a mammalian tissue sampl comprises establishing the level of expression in the test tissue samp of the genes.
                                                                                                                                                                                                                                                              Claim

Claim SEQ D Ö 289pp; English.

The invention describes an isolated human secreted protein (SECP) copypeptide. Also described are: an isolated polynucleotide encoding the polypeptide; a recombinant polynucleotide; comprising a promoter sequence operably linked to the polynucleotide; a cell transformed with the recombinant polynucleotide; a transgenic organism comprising the recombinant polynucleotide; a method of producing the polypeptide; an isolated antibody that specifically binds to the polypeptide; a method of detecting a trarget polynucleotide in a sample; a method for treating a coverexpression of functional SECP; a method of screening a compound for compound that specifically binds to, or that modulates the activity of, the polypeptide; a method of screening a compound that specifically binds to, or that modulates the activity of, the polypeptide; a method of assessing toxicity of a test compound; a compound that specifically binds to, or that modulates the activity of, the polypeptide; a method of assessing toxicity of a test compound; a compositio test for a condition or disease associated with the expression of SECP in a biological sample; a method of diagnosting a condition or disease associated with the expression of SECP in a subject; a composition comprising the antibody and a carrier, or the polypeptide, or a sample; a method of purifically a method of detecting the polypeptide, or a sample; a method of proposition profile of a sample that contains affixed in distinct physical locations on a solid substrate, where at least one of the nucleotide molecules comprises a first oligonucleotide

The polypeptide is useful for preparing a composition for diagnosing or treating a disease or condition associated with decreased expression or overexpression of functional SECP e.g. autoimmune disorders, obesity or cancer. This sequence encodes a human secreted protein.
                                                                                                                                                                                                                                                                                                                                                                                                                                        equence

                                                                                                                                                                                                                                                                                                                                                                      The invention relates to polynucleotides (AAK51456-AAK53435) and the encoded polypeptides (AAM78323-AAM80302) that exhibit activity elating to cytokine, cell proliferation or cell differentiation or which may induce production of other cytokines in other cell populations. The polynucleotides and polypeptides are useful in gene therapy, vaccines or peptide therapy. The polypeptides have various cytokine-like activities, e.g. stem cell growth factor activity, haematopoiesis regulating activity, tissue growth factor activity, immunomodulatory activity and activin/inhibin activity and may be useful in the diagnosis and/or treatment of cancer, leukaemia, nervous system disorders, arthritis and inflammation. Note: Records for SEQ ID NO 2110 (AAK52581), 2111 (AAK52582) and 3666 (AAM80020) are omitted as the relevant pages from the sequence listing were missing at the time of publication

                                                                                                                                                                     The gene coding for human alkaline phosphatase is fused downstream of a gene coding for either the variable and CH1 regions of an antibody heavy chain or an antibody light chain. Coexpression of the H- and L-chain sequences, one of which is fused to the AP gene, results in production of AP-labelled antibodies suitable for use in immunoassays. The present sequence is an insert from plasmid pXPD coding for human IgG heavy chain constant region sequences (CH1-hinge- CH2) fused to a partial AP-coding region; the insert also encodes the xanthine-guanine phosphoribosyl transferase from E.coli

AAT27392
     The gene coding for human alkaline phosphatase is fused downstream of a gene coding for either the variable and CH1 regions of an antibody heavy chain or an antibody light chain. Coexpression of the H- and L-chain sequences, one of which is fused to the AP gene, results in production of AP-labelled antibodies suitable for use in immunoassays. The present sequence is an insert from plasmid pXPE coding for human IgG heavy chain constant region sequences (CH1-hinge- CH2) fused to a partial AP-coding region; the insert also encodes the xanthine-guanine phosphoribosyl

phosphatase (AP)-antibody fusion of antibody heavy or light chain, protein -useful as

40-43; 44pp; Japanese

The gene coding for human alkaline phosphatase is fused downstream of a gene coding for either the variable and CH1 regions of an antibody heavy chain or an antibody light chain. Coexpression of the H- and L-chain sequences, one of which is fused to the AP gene, results in production of AP-labelled antibodies suitable for use in immunoassays. The present sequence is an insert from plasmid pCHIP-1 coding for human IgG heavy chain constant region sequences (CH1-hinge) fused to a partial AP-coding region via a 17 amino acid linker

                                                                                                                                                                coding for human alkaline phosphatase (AP) is fused downstream coding for either the variable and CH1 regions of an antibody in or an antibody light chain. Coexpression of the H- and L-quences, one of which is fused to the AP gene, results in on of AP-labelled antibodies suitable for use in immunoassays. Sent sequence is an insert from plasmid pVP5 coding for human IgG ain constant region sequences (CH1-hinge) fused to a partial AP-

COMPUTER READABLE FORM:

MEDIUM TYPE: Floppy disk

COMPUTER: IBM PC compatible

OPERATING SYSTEM: PC-DOS/MS-DOS

SOFTWARE: Patentin Release #1.0, Ve

CURRENT APPLICATION DATA:

APPLICATION NUMBER: US/09/305,681

FILING DATE:

CLASSIFICATION:

INFORMATION FOR SEQ ID NO: 1:

SEQUENCE CHARACTERISTICS:

LENGTH: 1798 base pairs

TYPE: nucleotide

STRANDEDNESS: single strand

TOPOLOGY: linear

MOLECULE TYPE: genomic DNA

APPLICANT:

TITLE OF INVENTION: Highly active alk

NUMBER OF SEQUENCES: 54

COMPUTER READABLE FORM:

MEDIUM TYPE: Floppy disk

COMPUTER: IBM PC compatible

OPERATING SYSTEM: PC-DOS/MS-DOS

SOFTWARE: Patentin Release #1.0, Ve

CURRENT APPLICATION DATA:

APPLICATION NUMBER: US/09/305,681

FILING DATE:

CLASSIFICATION:

INFORMATION FOR SEQ ID NO: 3:

SEQUENCE CHARACTERISTICS:

LENGTH: 2460 base pairs

TYPE: nucleotide

STRANDEDNESS: single strand

TOPOLOGY: linear

MOLECULE TYPE: genomic DNA

Sequence 19, Application US/09837863;
Patent No. 6468754;
GENERAL INFORMATION:
APPLICANT: Greene, Amy
APPLICANT: Thode, Silke
APPLICANT: Thode, Silke
APPLICANT: Jarnigan, Kurt
TITLE OF INVENTION: Vector and Method for Targeted Replacement and
TITLE OF INVENTION: of an Integrated DNA Sequence
FILE REFERENCE: 025.1US
CURRENT APPLICATION NUMBER: US/09/837,863
CURRENT FILING DATE: 2001-04-17
PRIOR APPLICATION NUMBER: US 60/198,498
PRIOR FILING DATE: 2000-04-18
NUMBER OF SEQ ID NOS: 27
SOFTWARE: PatentIn version 3.0
                                                                           밁
